To whom it may concern

I was asked by Aquality comp. to conduct a clinical study on the effects of equanility water on the quality of the blood.

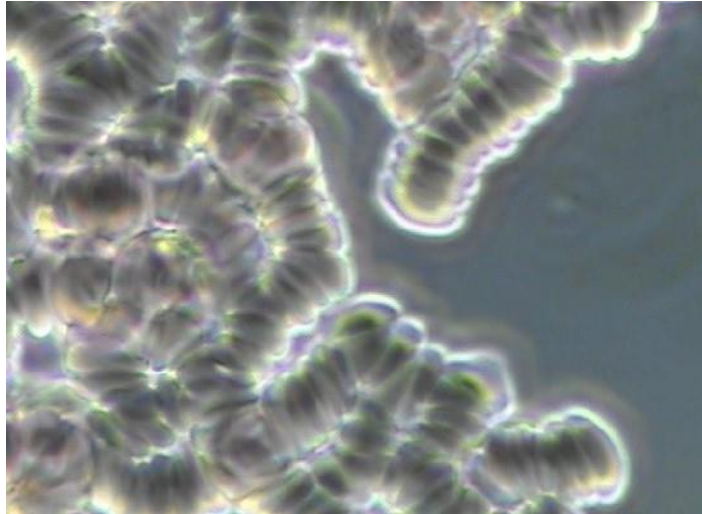

5 random subjects where selected for the test. Ages ranges from 17-58 years of age. 4 males and 2 females.

Using Meiji Microscope a live blood microscopy evaluation was performed on all 6 subjects. Immediately following the test the subjects where given a bottle of Aquality and where asked to drink just from the bottle provided.

24 hours later another live blood microscopy test was taken and the results are :

Subject #1: the initial live blood test showed that the red blood cell are stuck together/ A phenomena known as Rouleas syndrome.

The main blood evaluation the body is being acid and

related symptomologies. His foundational theory is that all functions of the human organism are acidic and that the ideal state of the body is alkaline by design.

purpose of is to show how challenged by indications of

It is well recognized that blood shows biological changes when the body is experiencing symptoms of sickness and disease. Empirically, after many years of research by numerous scientists, it has been discovered that certain blood profiles are associated with certain health challenges.

Pictures of blood samples reflect the type, degree and area of acidification as well as the affects of the acidification in the body. Nutritional and lifestyle changes can than be made to alkalize and restore the alkaline/acid balance (pH balance) in the body.

The information in, and findings made from, your blood demonstration report are, therefore, made in accordance with Dr. Young's understandings, as in The New Biology. The findings will make it possible to indicate, beneficial and appropriate, nutritional and lifestyle changes that could be made by you to alkalize and restore an alkaline/acid balance to your body.
